String important questions and answers:

1.Check whether a string is palindrome:

Question Explanation:
A palindrome is a string that remains the same when read from left to right and right to left.

Example:

madam → Palindrome
hello → Not Palindrome

```
s = input()

rev = ""

for ch in s:
    rev = ch + rev

if s == rev:
    print("Palindrome")
else:
    print("Not Palindrome")
```

2.Count the frequency of each character.

Question Explanation:
Count how many times each unique character appears in the given string.

Example:

Input: banana

Output:
b 1
a 3
n 2

```
s = input()

x = ""

for ch in s:
    if ch not in x:
        count = 0

        for i in s:
            if ch == i:
                count = count + 1

        print(ch, count)
        x = x + ch
```

3.Find the first non-repeated character.

Example:

Input: hello
Output: l

```
s = input()

for i in range(len(s)):
    count = 0

    for j in range(len(s)):
        if s[i] == s[j]:
            count = count + 1

    if count > 1:
        print(s[i])
        break
```

(or)

```
s = input()

for i in s:
    count = 0

    for j in s:
        if i == j:
            count = count + 1

    if count > 1:
        print(i)
        break
```

4.Find the first non-repeated character:

Input:
swiss

Output:
w

```
s = input()

for i in s:
    count = 0

    for j in s:
        if i == j:
            count = count + 1

    if count == 1:
        print(i)
        break
```

5.Remove duplicate characters.

Input:
Programming

Progamin

```
s = input()

x = ""

for i in s:
    if i not in x:
        x = x + i

print(x)
```

6. Find the Longest Word:

Question Explanation:
Given a sentence, find the word that contains the **maximum number of characters**.

Input:
I love programming

Output:
Programming

```
s = input()

words = s.split(" ")

longest = words[0]

for word in words:
    if len(word) > len(longest):
        longest = word

print(longest)
```

7.Find the Shortest Word:

Question Explanation:
Given a sentence, find the word that contains the **minimum number of characters**.

Input:
I love programming

Output:
I

```
s = input()

words = s.split()
shortest = words[0]

for word in words:
    if len(word) < len(shortest):
        shortest = word

print(shortest)
```

8. Check whether two strings are anagrams:

Meaning:
Two strings are anagrams if they contain the **same characters with the same frequency**, but the order can be different.

Example:

listen
silent

Frist way:

```
s1 = input()
s2 = input()

if sorted(s1) == sorted(s2):
    print("Anagram")
else:
    print("Not Anagram")
```

Second way:

```
s1 = input()
s2 = input()

if len(s1) != len(s2):
    print("Not Anagram")
else:
    flag = True

    for ch in s1:
        count1 = 0
        count2 = 0

        for i in s1:
            if ch == i:
                count1 = count1 + 1

        for i in s2:
            if ch == i:
                count2 = count2 + 1

        if count1 != count2:
            flag = False
            break

    if flag:
        print("Anagram")
    else:
        print("Not Anagram")
```
